

Equalizer Passion v.1 is an Analog Equalizer (concept).

If you expect flat frequency response, just go to another Parametric Digital Equalizer in the market. Equalizer Passion v.1 is built to be different, it is not trying to emulate specific brand/equalizer but take the concept of analog device in electronic scheme.

In usual digital equalizer, boosting will change the character of the track (sound weird). In Equalizer Passion, just Happy Boosting!

For starting point use default preset to get started, because it close to original track. Every move in Freq, Gain and Q will change the sound, even only move the Q without moving the Gain or even you just move the Freq. Its totally remove digital harshness.

The top left is Bass freq range, bottom left is Mid Bass freq range, bottom right is Mid High freq range and top right is High freq range. IN and OUT volume control. Press Knob ("0" for natural "1" for pressing signal) and On Off switch.

Note:

Avoid Peak as possible, from your signal input to output signal of the plugin and **TRUST YOUR EAR.**

All the Default setting is the recommended starting point of the sound. Turn down your audio system volume to prevent any damage.

THE BEST OF IT → EQUALIZER PASSION V.1 is totally free! Do not SHARE the plugin without this documentation/manual and Do not RESKIN/SELL the plugin. I would be appreciating if you give comment, critic and suggestions.

Big thanks to Christian Budde Analyzer, any digital recording forum, literature on internet and people who direct and indirect help me!
